AKKA

Reliable AI for Every Industry
The Agentic Systems Platform

Why Akka Beats RegattaDB

Agentic AI Platform vs. Distributed Database — Why a Database Is Never Enough

Confidential — Internal Use Only | April 2026

18 yr	99.9999%	<10ms	19+
PRODUCTION RUNTIME / 100K+ DEPLOYMENTS	AVAILABILITY SLA	AGENTIC MEMORY READ/WRITE	COMPLIANCE CERTIFICATIONS

DIMENSION	REGATTADB	AKKA
Platform Scope	Distributed database only — orchestration, governance, and streaming must be sourced and integrated separately	Full-stack: agents, orchestration, memory, streaming, governance — one platform, one bill
Agent Orchestration	Not included — requires LangChain, Temporal, or another framework to coordinate agents	Built-in multi-agent orchestration (A2A + ACP), durable workflows, autonomous and sequential agents
Production Maturity	Emerged from stealth March 2024 — no public customer case studies, no named references	18 years, 100,000+ deployments, 2B+ daily users — Morgan Stanley, Manulife, Verizon, Apple
Governance & Compliance	No published compliance certifications found — compliance posture must be built by the customer	19+ certifications (EU AI Act, ISO 42001, SOC 2, Singapore Agent Framework); runtime-embedded governance
Availability SLA	HA/DR details undisclosed; no public SLA published	99.9999% active-active HA/DR; sub-1 min RTO; zero byte RPO; backed by indemnities
Vendor Lock-In	Fully proprietary — patented concurrency control, custom storage format, no open source	Source-available (BSL → Apache 2.0); deploy on any cloud, on-prem, or Akka's managed cloud

1. A Database Is 20% of the Stack

RegattaDB solves the data layer — persistent, distributed, transactional storage for AI agents. That is one piece. The remaining 80% of the agentic stack still needs to be sourced, integrated, and operated:

- **Agent orchestration** — coordinating agents, handoffs, A2A protocols
- **Durable workflow execution** — long-running, fault-tolerant agent processes
- **Real-time streaming** — sensors, feeds, event loops for agent feedback
- **Governance & policy enforcement** — guardrails, audit trails, human intervention
- **Observability & FinOps** — tracing, token tracking, cost optimization

Akka: One Platform, No Assembly Required

Orchestration, agents, memory, streaming, APIs, and governance all run on Akka's shared compute. One SDK. One runtime. One bill. No integration layer to build or maintain.

2. Emerging Product vs. Proven Platform

Metric	RegattaDB	Akka
Founded / GA	2019 founded; stealth until Mar 2024	Runtime in production since 2009
Customer Cases	No public case studies	Manulife, Verizon, Morgan Stanley, Apple
Daily Users	Not disclosed	2 billion+ touch Akka-powered apps daily
Deployments	Not disclosed	100,000+ production deployments
Compliance Certs	None published	19+ (EU AI Act, SOC 2, ISO 42001)
Availability SLA	Not published	99.9999%, backed by indemnities

Enterprise AI systems fail silently, at scale, and at the worst times. Regulated industries — insurance, banking, healthcare — cannot stake production workloads on a database with no public SLA, no customer references, and no compliance certifications.

> *"RegattaDB is purpose-built AI data infrastructure. We offer a highly performant data store. Orchestration and governance require complementary frameworks."*
>
> — Regatta product positioning, regatta.dev (requires separate integration stack)

M

Manulife — #1 Life Insurance Company for AI Maturity — Chose Akka

Manulife, ranked #1 life insurance company for AI maturity, selected Akka to operationalize agentic AI for customer and colleague decision-making at enterprise scale. The deciding factors: **production-grade HA/DR and cost effectiveness**. They needed a platform they could trust with production AI — not a database they would need to build a platform around.

akka.io/blog/manulife-selects-akka-to-operationalize-agentic-ai

3. Governance: Embedded vs. Non-Existent

RegattaDB has no published compliance posture

- No SOC 2, HIPAA, GDPR, ISO 42001, or EU AI Act certifications found
- Customers in regulated industries must build their own compliance layer
- No runtime policy enforcement, guardrails, or audit trail tooling
- PII handling, human intervention, and explainability are out of scope

Akka: Governance is a runtime property

- 19+ compliance certifications — inherit Akka's posture instead of building your own
- Inline policy enforcement: guardrails, LLMs-as-judge, and sanitizers at runtime
- Immutable interaction logging — every decision witnessed and encoded
- Human pause/override/redirect for any running agentic process
- EU AI Act & Singapore Agent Framework certified

4. Agentic Memory: Purpose-Built vs. Query-Based

RegattaDB provides a high-performance SQL database — agents read and write state via SQL queries. This works, but it is not the same as purpose-built agentic memory:

Capability	RegattaDB	Akka Memory
Read/Write Latency	SQL query overhead; connection pooling required	<10ms — sharded in-memory, no query planner
Memory API	ANSI SQL via JDBC/ODBC; schema management burden	Native SDK APIs — no schema design required
Agent Context	Must be modeled as relational schema by developer	Durable, sharded state native to the agent runtime
Failover	HA configuration not publicly documented	Active-active; sub-1 min RTO; zero byte RPO
Scale	Linear database scaling; storage I/O can bottleneck	10M agentic TPS with scale-to-zero

Bolt-on memory at ~200ms — typical in LangChain stacks — forces redundant LLM calls and inflates token costs. Akka's sub-10ms memory is 20x faster and integrated into the runtime.

5. Vendor Lock-In: Proprietary IP vs. Source-Available Platform

RegattaDB: deep proprietary lock-in

Lock-In Layer	Risk
Concurrency Control	**Patented CCP — proprietary, not replicable elsewhere**
Storage Format	**Custom raw-block layout, no standard file system — migration requires full data export**
Source Code	**Fully closed — no visibility into internals, no community, no audit path**
Pricing	**No public pricing — zero budget visibility before vendor engagement**
Customer References	**No named customers — no peer validation available**

A $58M-funded startup with patented proprietary internals, no published SLA, and no customer case studies is a concentration risk — not just a technology bet.

Akka: open and portable by design

- **Source-available** — BSL license converting to Apache 2.0; code is inspectable and auditable
- **Any cloud** — deploy on Akka's cloud, your hyperscaler VPC (AWS, Azure, GCP), your own Kubernetes, or on-prem
- **Same APIs everywhere** — no proprietary lock-in at identity, orchestration, data, or governance layers
- **Transparent pricing tiers** — Fast Prod, Day 2 Ops, Business Continuity, Sovereign Cloud
- **Named enterprise customers** — Manulife, Verizon, Morgan Stanley, Apple, Starbucks, RBC, Capital One

> *Akka is backed by 18 years of production use, more than 100,000 deployments, and a runtime that 2 billion people touch every day — including 52 banks running Akka in production.*

> — akka.io/llms.txt

Side-by-Side: What You Must Build Without Akka

Capability Required	RegattaDB + DIY Stack	Akka
Agent orchestration	Buy/build separately — LangChain, Temporal, or custom; each adds operational overhead and integration cost	Built in — multi-agent orchestration (A2A + ACP), durable workflows, sequential and autonomous agents
Durable agentic memory	RegattaDB via SQL queries — schema design burden, connection pooling, query latency	Native sub-10ms sharded in-memory state — no schema, no query planner, no connection pool
Real-time streaming	External Kafka + consumer framework required; additional ops burden	Built in — high-performance continuous data processing for AI feedback loops
Policy enforcement & guardrails	Not provided — must bolt on a third-party governance layer reading logs after the fact	Inline at runtime — guardrails, sanitizers, LLMs-as-judge executing before tokens are consumed
Compliance certifications	Not provided — customer must obtain SOC 2, ISO 42001, EU AI Act coverage independently	Inherit Akka's 19+ certifications — EU AI Act, SOC 2, ISO 42001, Singapore Agent Framework
HA/DR with SLA	No published SLA; HA configuration undocumented; no indemnity-backed guarantee	99.9999% active-active HA/DR; sub-1 min RTO; zero byte RPO; contractual indemnities
Spec-driven development	Not applicable — database only, all application tooling must be sourced elsewhere	Plain language specs generate production-ready systems — PMs and analysts can contribute directly

Handling Common Objections

"RegattaDB is purpose-built for AI agent workloads"

"RegattaDB is purpose-built for the data layer of AI agents — a faster, distributed Postgres. Agents still need orchestration, streaming, governance, and memory management. RegattaDB requires an integration stack around it. Akka is the integration stack, with memory already built in."

"RegattaDB has stronger transactional guarantees"

"RegattaDB's serializable isolation is impressive for a database. Akka is not a general-purpose database — it is an agentic runtime with durable in-process memory. For agent state, Akka's sub-10ms native memory outperforms any SQL query path. For external relational data, Akka integrates with your existing database of choice."

"We need a specialized AI database alongside Akka"

"RegattaDB is cheaper because it's just a database"

"RegattaDB has no published pricing. Once you add orchestration, governance, streaming, observability, and compliance tooling to the stack, the all-in cost will exceed Akka's shared compute model. Akka's 90% infrastructure cost reduction is measured against the full assembled stack — not a single component."

"RegattaDB is a drop-in Postgres replacement — easy to adopt"

"Postgres compatibility is a migration story, not an agentic AI story. The challenge is not migrating your existing data. The challenge is building, governing, and operating reliable agentic AI in production. That requires a platform — not a database."

"We'll use RegattaDB as the memory layer under Akka"

"Akka's memory layer handles durable agent state at sub-10ms. For vector search, Akka integrates with your preferred vector database. If you also need a distributed SQL layer for external data, that can be a separate integration — but Akka is not a replacement for a general database, and RegattaDB is not a replacement for an agentic platform."

"You can. Akka integrates with external data stores. But Akka's built-in memory is already durable, sharded, and sub-10ms — an order of magnitude faster than any SQL path. Unless you have an existing RegattaDB investment, adding it creates cost and complexity without a performance advantage."
